
Installing MicroPython on ESP32

Aldo Núñez Tovar

Introduction

We present a procedure to install `MicroPython` on the `ESP32` microcontroller. It was carried out on the `GNU/Linux` platform and using open source tools.

We also install `Thonny IDE`, a lightweight program and multiplatform, to edit and execute `MicroPython` programs.

This procedure was done using `Debian GNU/Linux 12 (bookworm)`. And the microcontroller was `ESP32-WROOM-32U`

This tutorial can be downloaded from `github`, `https://github.com/lizard20/esp32`

Requirements

We need a computer with internet access and the microcontroller connected via the `USB` port, Figure 1.

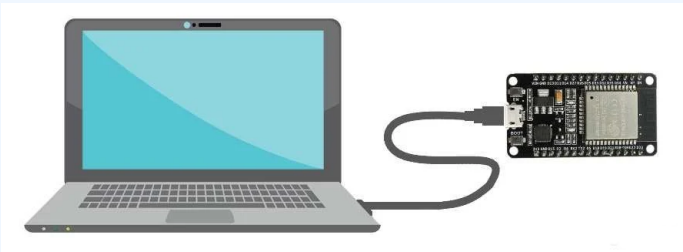

Figure 1. Connection between computer and ESP32

To install `MicroPython` we need a microcontroller with at least `16 KB` of `RAM` memory and `256 KB` of `ROM` memory.

The `ESP32 WROOM` has `520 KB` of `RAM` memory and `448 KB` of `ROM` memory

Components and accessories

1. Microcontroller `ESP32`
2. usb to micro usb cable

Install MicroPython and tools

1. Download `MicroPython`
2. Download and install `esptool` program. This tool is to install `MicroPython` on the microcontroller.
3. Download an install the `mpremote` program. This tool is to upload and execute, `MicroPython` programs in the microcontroller.

We assume that the device used to communicate with the microcontroller is the file `/dev/ttyUSB0`. In other cases, the device could be different. List the `/dev` subdirectory to find out which device your computer is using.

```
$ ls -ltr /dev
```

1.- Download `MicroPython`.

First, we create the `esp32` subdirectory. It will be our workspace subdirectory.

```
$ mkdir esp32
$ cd esp32
```

Next, go to: `https://micropython.org/download/` and select your microcontroller model.

In our case we choose `ESP32` microcontroller: `https://micropython.org/download/ESP32_GENERIC/`

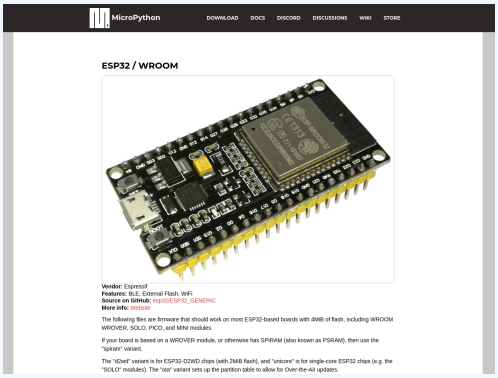

Figure 3. downloads

Then, scroll down until the `Firmware` section and select the most recent release: `v1.24.1(2024-11-29).bin`. Dowload this file to the `esp32` subdirectory

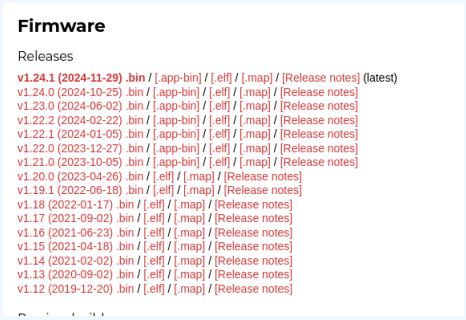

Figure 4. Firmware

The downloaded file is: `ESP32_GENERIC-20241129-v1.24.1.app-bin`

2. Download `esptool`

```
~/esp32/$ git clone https://github.com/espressif/esptool.git
```

After executing the previous command, the esptool subdirectory will have been created.

First, erase the entire flash memory.

Change to the esptool subdirectory

```
~/esp32/$ cd esptool
~/esp32/esptool/$ python -m esptool --port /dev/ttyUSB0 erase_flash
```

Then, install MicroPython on the microcontroller

```
~/esp32/$ cd esptool
~/esp32/esptool/$ python -m esptool --chip esp32 --port /dev/ttyUSB0 --baud
    460800 write_flash -z 0x1000 ../ESP32_GENERIC-20241129-v1.24.1.bin
```

At this point and if there wasn't any problem we have installed MicroPython successfully on the ESP32

Once installed MicroPython, press the EN button on the ESP32.

3. Install mpremote

We can use any serial communication program to connect to the microcontroller. In our case we will install the mpremote program to interact with the ESP32

```
$ pip install mpremote
```

Now, we can connect to the microcontroller

```
$ mpremote connect /dev/ttyUSB0
Connected to MicroPython at /dev/ttyUSB0
Use Ctrl-] or Ctrl-x to exit this shell
```

Press Enter.

When the interpreter starts, it displays a message and the MicroPython prompt appears where programs can be written in a loop called "read-evaluation-print loop" or REPL.

```
>>>
```

Type help() and MicroPython will print messages to interact with ports and to configure WiFi

```
>>> help()
Welcome to MicroPython on the ESP32!
For online docs please visit http://docs.micropython.org/
For access to the hardware use the 'machine' module:
import machine
pin12 = machine.Pin(12, machine.Pin.OUT)
pin12.value(1)
...........
```

We can interact with the esp32 through the MicroPython interpreter.

For example, let's turn on and turn off a LED connected to Port 2 through a 220 Ohms Resistor, Figure 5

First, import the Port class from the machine module

```
>>> from machine import Pin
```

Then, declare a led object using the Port 2 as output

```
>>> led = Pin(2, Pin.OUT)
```

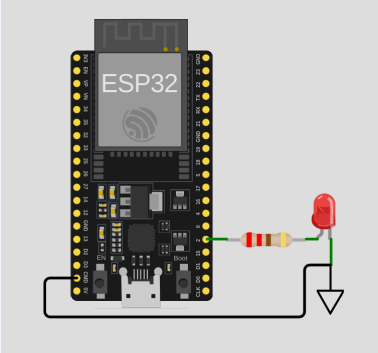

Figure 5. LED connected to Port 2

Turn on the `LED`

```
>>> led.on()
```

Turn off the `LED`

```
>>> led.off()
```

As you can see it is easy to interact with the microcontroller using `MicroPython`.

Create your first progran in MicroPython

Let's create the `programs` subdirectory in `esp` directory

```
~/esp32/$ mkdir programs
~/esp32/$ cd programs
```

Now, inside `programs` we are going to edit `blink.py` program. Open your favorite text editor.

```
from machine import Pin
from time import sleep

'''
    Blink a Led connected to port 2
    of the esp32 microcontroller
'''

PORT = 2
SECONDS = 0.5

led = Pin(PORT, Pin.OUT)

while(True):
    led.on()
    sleep(SECONDS)
    led.off()
    sleep(SECONDS)
```

Execute `blink.py`

```
~/esp32/programs/$ mpremote run blink.py
```

Now, we can observe the blinking of the LED every `0.5` seconds. To stop the execution of the `blink.py` program press `Ctrl+c`.

To list the files in the flash memory of the microcontroller

```
~/esp32/programs$ mpremote ls
ls :
         139 boot.py
```

To upload the `blink.py` program to the microcontroller

```
~/esp32/programs$ mpremote fs cp blink.py :blink.py
```

Now, execute the list command again

```
~/esp32/programs$ mpremote ls
ls :
         318 blink.py
         139 boot.py
```

To print the options of `mpremote` program type:

```
~/esp32/programs$ mpremote --help
```

Installing Thonny IDE

`Thonny` is a free Python IDE alternative. It is suitable for those who are just starting to learn Python.

1. Download

Go to `https://thonny.org/` and download the version of the program corresponding to your operating system: `Windows`, `Mac` or `Linux`

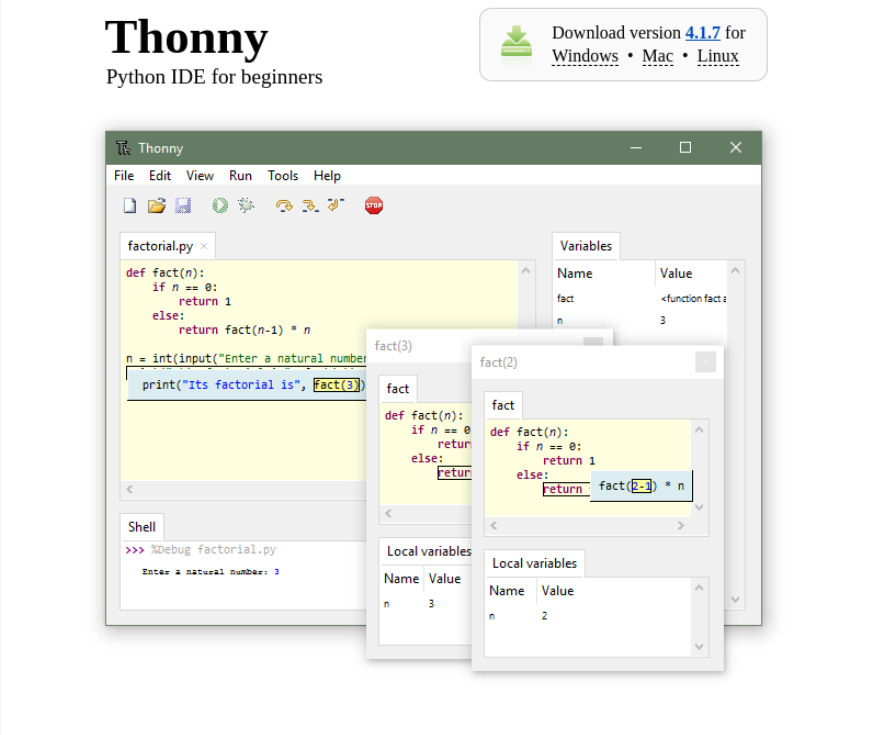

Figure 6. Download Thonny

2. Install:

In our case, we have downloaded `thonny-4.1.7-x86_64.tar.gz` file, corresponding to `Linux OS`, to `esp32` subdirectory

Unpack the downloaded file

```
1 ~/esp32$ tar zxvf thonny-4.1.7-x86_64.tar.gz
```

A subdirectory `thonny` will be created. Change to this subdirectory and install

```
~/esp32$ cd thonny
~/esp32/thonny$ ./install.py
```

Now, we are ready to open `Thonny IDE`.

At the top we have the editor and at the bottom the `Python` interpreter, Figure 7

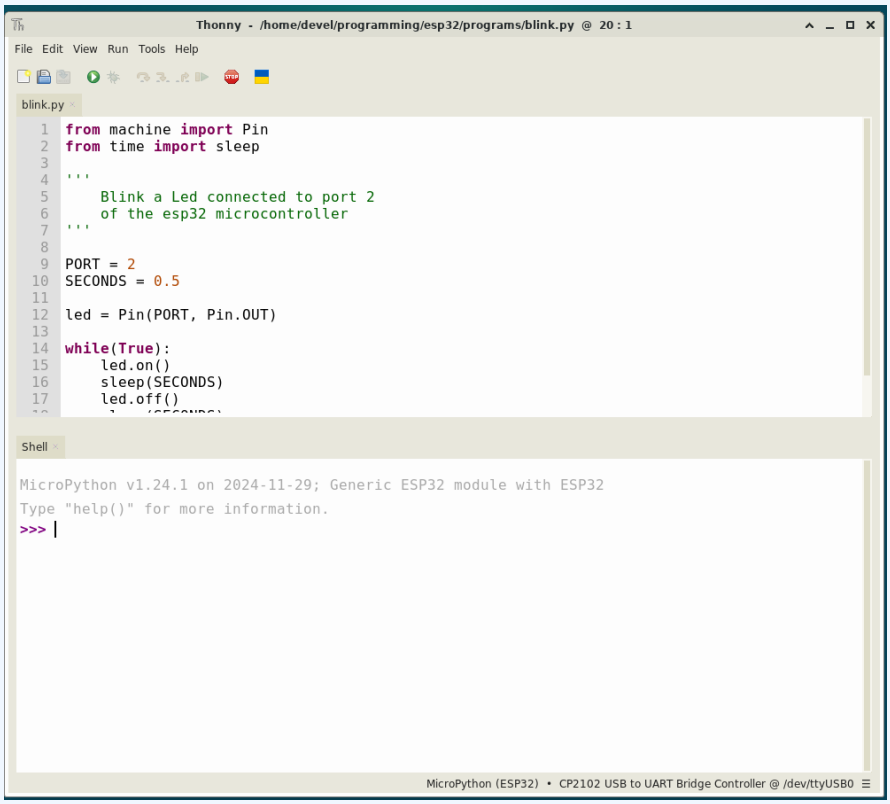

Figure 7. Thonny IDE

With this `IDE` we can easyly interact with the microcontroller. We can edit, execute, upload, remove `MicroPython` programs.
